

Olympic Data Visualization

During the Olympics there has always been a rivalry between Canada and the United States. In different sports either team has come out on top but Canada seems to prevail in one particular sport and that is Hockey. At least in recent years Canada has come out on top in both Mens and Womens Hockey. But in the earlier year the competition has gone both ways.

Looking at the Data for many years women have won 5 years overall. From 1998 to 2014. The Canadian Women have won Gold every year except for 1998 where they won silver. For the US Women they have been the second place for years winning silver for three years and gold only once in 1998. For the Canadian Men's teams they won gold for 6 years and only won silver twice before the 21st century. The US men's team did not have the same luck coming second most years to the Canadian but managing to win gold in 1960 and 1980. Canada has come out on top almost every year only losing to the US three times in Olympic Hockey since it introduction into the winter games. Showing that Canada performs better at the Olympics in Hockey has been proved for many years with some iconic wins and a streak that will be continued in Beijing in 2022.

With this data I intend to prove that Canada is better at Men's and Women's Hockey at the Olympics. The data speaks for itself and It proves that Canadians are the best at the game of Hockey and that no one can stop us.
